SKILLS SUMMARY

- **Fields:** Program Management, Mobile/Web App Development, UI Design, Privacy risk management, Data and metrics analysis
- **Technologies:** iOS, Git, AWS, CSS, Jira/Confluence, AI agents, GenAI tools, LLM-based automation
- **Programming:** Java, C#, Swift, AngularJS, Python
- **Project management:** Agile/sprint methodology, metrics analysis. App and product development for medium and large software development projects in US, Canada and Europe. Stakeholder management, engaging and managing expectations for various cross functional stakeholders.

EDUCATION

University of Waterloo

Honors Bachelor of Computer Science, Business Option, Co-op Program

Waterloo, ON

2007 – 2012

WORK EXPERIENCE

Meta Platforms Inc.

Seattle, WA

Technical Program Manager – Growth, Core Product

May 2021 – Present

- Leading the delivery of 4 concurrent programs in centralizing user settings across all Meta apps and platforms (Facebook, Instagram, Oculus, WhatsApp) and working with cross-functional teams to launch globally to +2 billion users
- Drove adoption of a new design system from 0 to 70+ products in under 2 years — launching the first 5 onboarded products and proving benefits and efficiencies to partner teams.
- Ran road mapping, capacity planning, and sprint planning across 5 teams for the cross-app design system — prioritizing work, delivering components and frameworks, and providing technical support with clear leadership visibility into priorities and resource allocation.
- Built a scalable intake process for partner engagement with the Meta Account — consolidating two separate intake processes into one system with scoped request forms and impacted-surface capture — triaging 45+ requests across six product surfaces as the platform scaled toward 30+ integrated apps.
- Led the global launch of the migration from multiple linked accounts to one account with multiple profiles across four organizations and 80+ countries — partner point-of-contact, created staged rollout plan, and ran central launch command with war-room operations, preemptive incident mitigation, and on-call layering across 11 workstreams — shipping with top-tier metrics neutral, zero rollbacks, and no single-team dependency able to block the release.
- Ran daily command-center operations holding workstream leads to milestone commitments and led a risk-based defect burndown with program-wide prioritization — escalating an emerging critical-path risk before it became blocking — keeping testing and staged-rollout phases on schedule.
- Authored the program's defect management plan — tagging schemas, production operations workflows, and in-app bug-reporting integration — creating a repeatable system to classify and clear multi-hundred-issue backlogs ahead of each launch gate.
- Deployed multiple AI agents that eliminated recurring manual work: an intake triage agent that auto-resolves the majority of incoming requests (handling time cut from 15–30 minutes to under 30 seconds) and a bug classification agent covering 18 product categories with content-based detection — scaling high-volume intake and defect inflow without added headcount.
- Owned the account management integration into the launch for Vibes app — requirements definition, 10+ partner teams, iOS/Android account-flow test sprints, and daily status in the program tracker — then extended the launch framework to a second app and drove its last-minute addition into the release with a three-week quality sprint that closed ~60 blocking defects across multiple products.

Amazon Inc.

Seattle, WA

Technical Program Manager – Customer Delivery Experience

Sept 2019 – May 2021

- Leading the delivery of a large-scale migration project of the most trafficked pages on Amazon's retail website
- Working with more than 10 external teams simultaneously to commit and implement feature upgrades and migration to customer facing delivery tracking pages
- Creating and managing a worldwide tax and consumer protection compliance project impacting customer facing pages on Amazon's retail website
- Creating the system design architecture for a new service and API that will show a customer's order total breakdown across all pages on the retail website
- Responsible for owning, maintaining and improving the delivery experience intake process which interfaces with over 100 teams across Amazon to allow for integration of features into customer-facing properties owned by our team including new products, features and marketplaces
- Creating and maintaining the yearly and quarterly team plan for the Your Orders team to prioritize goals, plan resourcing needs and report updates to the organization leadership team
- Leading the sprint planning sessions for the Your Orders team and working with SDM's to prioritize, track and report on progress, velocity and effectiveness of team sprints
- Working with SDE's to capture team feedback and retrospectives on how to constantly improve efficiency, collaboration and visibility across the team

Deloitte Digital

Toronto, ON

Manager / Senior Consultant – Systems Integration

Aug 2017 – Sept 2019

- Led the front-end engineering team in Canada building modern web and mobile applications (AngularJS, React, iOS, Android), and engaged new clients with business strategy recommendations to define digital solutions.
- Development lead and solution architect for iOS/iPad applications for large Canadian oil & gas and utility clients, an Angular web application for online retail mortgage purchases, and a wealth management web application.
- Development lead integrating multiple ERP systems into a supply chain optimization engine; built an iOS Apple Watch executive-communications app and an AngularJS ServiceNow portal managing 1B+ assets for a technology client.

TD Bank

Toronto, ON

Mobile Solution Architect – Direct Channels Technology Solutions

Mar 2014 – Dec 2014

- Developed UML artifacts and views to support architectural deliverables that leverage TD's technology and Business reference models.
- Worked with project teams to document and ensure alignment of architectural and design best practices while being sensitive to budget, timelines and technology constraints.
- Drive discussions with architects and SME's to build a technology reference model aiming to simplify, standardize, and govern technology
- Work with Networking and Operations team to deploy Cloud POC hardware into Datacenter to evaluate performance and capabilities for vendor selection
- Contributed to architecture design decisions for TD's Mobile Wallet platform
- Created a series of artifacts for the Mobile Payments project including; Architectural Risk and Governance assessment, Service Dependency diagrams and Sequence diagrams
- Created assessment of options by conducting multiple discussion sessions with delivery managers to improve delivery processes in Direct Channels as part of the Deliver Model Optimization program
